

Ideas:

Ideas:

- Plan 1: Investing

Wrote some ideas down in the some thoughts tab (Zachary)

Investing Ideas (with Breakdown) - Akash

- Alr so for my idea, I was thinking we could go pretty heavy into stable tech sectors while also reaching out to other areas like Banking/Treasury and Energy as a hedge or smth like that
- Here is my proposal, since we have 300k:
- MSFT
 - 60K
 - Reasoning: Microsoft is relatively stable and and has a really diversified portfolio, and JP Morgan identifies it up there, stating Microsoft is among the large-cap hyperscalers. it expects to remain important
- NVDA
 - 50K
 - Reasoning: It already has an enormous run and is doing really well, although it is pretty risky due to its aggressive growth. I think we need to put a solid amount of 50k in, but not too much so that if the market falls we just get cooked
- GOOGL
 - 45K
 - Reasoning: Really good diversification get google search, Gemini, etc.

- AMZN
 - 35K
 - Reasoning: Amazon gives you another AI/cloud angle through AWS while also giving the portfolio exposure to consumer spending. That's important because we don't want only AI stuff
 - GDP at 2.2%
- JPM
 - 25K
 - Reasoning: This is because of the fact that I personally want something outside of the tech sector since we have so much already. Also, it has 10yr Treasury Yield at 5.3% which is highest, and it's also pretty stable
- Energy ETF
 - 20K
 - If tech fails, we still have energy with potential benefits. I would also say NOT to invest in a specific oil company due to inflation.
- Some Treasury/ ETF
 - 50K
 - Honestly, this along with the 15K reserve does not need to be put out and we should hold this defensively, but I think some sort of treasury just may help us.
- Cash reserve just in case – around 15k

Some thoughts

Okay, given the timeframe and the current market liquidity, T-bills might not be the best option, so we might want to do for a stable investment into S&P. We can justify this saying, based on the current interest rates plus the time horizon that we're doing, look, it's an eight-year out long investment. The chance that the S&P is down is off for that time as well. And frankly, T-bills aren't going to save us if the S&P is screwed, then T-bills are even more screwed. At least, given the current climate.

I was thinking perhaps that we want to do i need to check the exact details, but we have to have \$500,000 for the 10 years of \$50,000 investments, right? So we want to put in the S&P such that at Time, we have exactly as much as we need. So, I can do the calculations back, but that would be good. Other than that, we'd put in slightly riskier investments such that we can generate more upside and have more money left over for the building, et cetera, and for her to keep. Okay, I will need to do some math on the \$500,000 goal thing. I'll need to look back at the exact contest rules to see how we can structure it to maximise the amount of time that money is in the market, and also maximise the amount of time that the money is in a well-divided, well-arranged portfolio. But just some thoughts. I don't know. This could just be completely wrong. I could just be completely missing the math

That would include things like we were thinking a tech basket, like a tech sector thing. Another one that's like a basket of the guys who make the hardware, so that would be like TSMC, Samsung, whatever, SK Hynix, all those things. And then a second basket that's like the people who make the final products, so that's NVIDIA, especially Tesla would be too risky. Apple, Samsung again, I guess. Well, we don't want to over-represent Samsung. And then a third one, which would be AI people we think will win, which is going to be people at the inference level, so things like Dell, Oracle, SpaceX, et cetera. Maybe if we want to put NVIDIA in there a second time.

And then only other random thing I was thinking was maybe Monster Energy. Two reasons:

1. First of all, it's the best performing stock of the last since it went public, it's like the best of all time.
2. We'll want to be in Berkshire too, just because I think they'll be a good, safe thing along with the S&P, perhaps.

I think no Dow, just because personally, I dislike how they run it. We can certainly do NASDAQ as a basket of medium risk. If we do have to invest in bonds, just because they'll require it. Well, since we can't get tax-free i can't find anything good over look, the problem is T-bills could go higher than that, and we don't want to hold T-bills that are going to be underwater. We'll see. This is just an idea.

Maybe we create a small “risky” portfolio of an amount we can fully afford to lose and put it into things like cerebras because they’re getting pummeled by the street i think very unfairly the demand once per token price stabilizes because we’re getting to a point in 3, 6, 9 months where we’re going to get 1 cent per mtok astra/opus 5.5 levels of intelligence and then the demand for speed will go parabolic. Frankly, we’re approaching a point where cognitively the AI labs can no longer differentiate themselves, and so they’re going to start to force the prices down simply by developing better models. That’s going to be a focus. They’re going to start marketing the faster things, and Cerebras is right there to pick up on that. I think that they are going to stand to be a major winner of that.

I think once you’ve experienced, well, I haven’t even fully experienced it, but if you’ve experienced Astra at 750 tokens per second well, you can’t get that right now. But if you’ve experienced Astra at 300 tokens a second even, or 5.6 at 750 tokens a second, the world is not able to go back from that. It’s like going from oh, I don’t know. I can’t think of a good example, but it’s a very insidious change in that your programmers will demand this. Your consumers will demand it. Once you’ve experienced it, it is a Pandora’s box. The genie cannot be put back into that bottle.

There is no one, once they’ve experienced Frontier Intelligence, because right now, Frontier Intelligence is not at high speed/acceptable cost, but once they do, that is simply unbeatable in terms of it becoming a baseline. I think a good analogy of it is in-flight Wi-Fi. Not directly. I don’t know. Whatever. But the point is, every airline started really adopting in-flight Wi-Fi after JetBlue noticed that consumers, they noticed that JetBlue, which had promised everyone Wi-Fi, they had to pay \$3,000 for it, but people were consciously shifting travel, the late-purchasing business travellers who support the airlines.

They were switching over to JetBlue specifically because they had Wi-Fi, and that was what drove more than people complaining online or whatever, the airline ad options of in-flight Wi-Fi. And they’re undergoing a second consumer preference cascade with regard to Starlink, where now people are making their flight decisions, based on whether their flights have Starlink or not, because it’s so much faster. The analogy here is having a token budget, engineers will demand that, and then this is the second step of Starlink, and people are going to make their decisions on whether they can have high speed. And so Cerebras is a big thing.

Sorry, I spent a whole page yapping about Cerebras. But another good one would be Palantir, frankly. I know it’s a bit risky from the political perspective, but it’s a good company. Well, frankly, we might want to put a little bit into i wonder if we can even buy it.

Look, ZAI, they’re the makers of GLM. They get beaten up by The Street. I mean, they are just pummelling on. They’re a target dummy for The Street, basically. But they’re the leading open source lab.

A good bet would be on their ability to do this sort of stuff, even if short-term it’s going to perform terribly. Another one might be Minimax Group. Again, they’re getting pummeled by The Street.

But maybe a little bit into Alibaba. Again, they're all making these open source models. The idea, of course, is that if we can convert this idea of skill into that. Next, I think they're being misvalued by The Street. So that could be a risky sector, if we want to think about that

Tab 3

Some things other ppl did

- In depth economic modeling
 - To inform on individual by giving us macro trends
- Finbert
- So sentiment + finbert+ how that factors into a larger model.

60% starting pt for S&P (model will shift). Debate t bills shift or not

The comp of the remainign 40% we should discuss
